RELEASE NOTES

Release EMEA 2021-04-13

New/changed features

- The fault service, which is responsible for analysis of fault detections and the rejection of other (non-fault) signals, has been restructured to allow better control and validation of each individual step in the process. This gives better insight into each step of the process, which can be used for further optimization of performance. A comprehensive test set of any fault condition possible was used to validate the code.

Fixed issues

- Small bug fixes.
