RELEASE NOTES

Release EMEA 2021-06-08

Internal improvements

Control Unit

Improvements

- After updating, the thresholdMultiplier will be reset. It should not take much time for the thresholdMultiplier to recover back as it is a volatile parameter.
- When the CFE address is changed via service mechanic interface, the new setting will be committed immediately.
- PD detection may yield different result, because thresholdMultiplier is no longer shared.

Known issues

- When downgrading from 2.3.0 to 2.2.0 or 2.1.2, the provided distributions of 2.2.0 and 2.1.2 have to be used. They have an upgrade script included which makes sure that the pd threshold range is compatible with the older firmware versions.

Changes in this release
Generic

- The Smart metering libraries are updated.
- The build environment now uses Gradle 6.8.3.

CFE (Communications Front End)

- New endpoint added to retrieve modem and network information from a CU.
- New endpoint to restart the modem of a CU.
